Abstract

Mutual funds have become a leading investment medium in India, driven by increased participation from the retail market and the necessity of diversification, liquidity, and professional management. This study explores STP in two different dimensions, namely- Daily Systematic Funds and Monthly Systematic Funds, while keeping lumpsum in the background. The current research compares these three approaches to investments through actual historical NAVs of top fund houses—HDFC, SBI, and ICICI Prudential—on large cap, mid cap, and small cap funds. The performance of each of these approaches is compared under three different market cycles (Pre-COVID, COVID, Post-COVID) to include both stable and volatile markets. Results show that none of the strategies perform better in all situations. Alternatively, the performance of every approach is influenced by fund type, market conditions, and investment frequency. The research presents evidence-based analysis on how investing approaches can be coordinated with market conditions and presents real-life advice for policymakers and retail investors to make more intelligent investment choices.

Keywords: Mutual Funds, Lump Sum, Systematic Transfer Plan (STP), Daily STP, Market Phases, Large Cap, Mid Cap, Small Cap, Investment Frequency, NAV, Indian Mutual Fund Industry

1. Introduction

Mutual funds have become one of the most dominant investment vehicles in India, indicating a pivot, especially in household savings and long-term wealth creation strategies among retail investors (Sujan, 2025). Since June 2025, India crossed 16 crore mutual fund portfolios, with the AUM rising from ₹23.2 lakh crore to ₹56.5 lakh crore in five years—an 18% CAGR (*The Hindu*, 2025). With 44 AMCs driving the industry, it is projected to cross over ₹100 lakh crore in AUM by 2030, making it one of the most upsurging markets globally.

This surge in retail investments is fuelled by an increase in retail participation, especially from the middle class, Gen Z, and millennials, who look at mutual funds for their affordability, simplicity, diversification, and professional management. These funds provide access to a mix of equity, debt, hybrid, and thematic assets. It is also tax-efficient and regulated and can outperform traditional instruments like FDs and gold—especially when it is invested through SIPs for the long-term gain. Further, fintech developments have eased its accessibility.

However, there is a significant gap: although product awareness is strengthening, investors remain unaware of any structured, data-driven knowledge of what to invest in, when to invest, and in what manner. Between lump sum, SIP, or STP, decisions are typically made on some sort of assumption or arbitrary emotional bias rather than behaviour based on evident market action or fact.

This research seeks to fill that gap by analysing real NAV data across fund types and market conditions to assess the effectiveness of different investment strategies. It aims to go beyond "what to invest in" and provide actionable, evidence-based insights into how to invest.

2. Literature review

a. **Sikdar (2021)** examined stock market volatility pre and post-COVID, showing significant differences in returns and transaction activity across sectors, highlighting heightened uncertainty in capital markets.

b. **Choudhary & Chawla (2014)** analysed diversified equity mutual funds in India, finding most schemes outperformed benchmarks on Sharpe and Treynor ratios, emphasizing professional management and risk-adjusted performance.
c. **Prasad (2024)** provided a decade-long analysis of mutual funds, stressing growth in AUM, investor confidence, and the role of SEBI reforms in shaping risk-adjusted performance and investor behaviour.
d. **Talamala et al. (2024)** highlighted mutual funds' importance in India, showing their ability to provide diversification, liquidity, and risk reduction, though investor awareness remains limited.
e. **Praveen Kumar & Lakshmi (2025)** conducted sector-wise analysis of volatility-return dynamics, revealing sectoral funds as high-return yet volatile, while debt funds offered stability; macroeconomic factors strongly influenced performance.
f. **Yuvaraj & Lavanya (2025)** compared active vs. passive strategies, finding active funds riskier with higher costs but potential outperformance, while passive funds provided stable, cost-efficient alternatives in efficient market segments.
g. **Venkataiah, Reddy, & Vadapalli (2020)** emphasized Systematic Transfer Plans (STP) as risk-reducing tools for lump-sum investments, using rupee cost averaging to mitigate market-timing risk and improve returns.
h. **Monika & Ahuja (2024)** conducted a comparative analysis of mutual funds using risk-return metrics, finding private sector schemes slightly riskier yet more rewarding than public ones, underscoring investor preference diversity.

3. Research Gap

The literature available discusses several important dimensions of mutual fund investment in India. Papers such as Sikdar (2021) and Praveen Kumar & Lakshmi (2025) focus on volatility–return relationships across varying conditions and sectors and reveal the large impact of macroeconomic changes on investment returns. Choudhary & Chawla (2014), Prasad (2024), and Monika & Ahuja (2024) focus on the efficiency and growth of actively managed funds and report systematic outperformance relative to benchmarks. Talamala et al. (2024) and Yuvaraj & Lavanya (2025) emphasize diversification as the role of mutual funds and contrast risk and cost of active and passive investment strategies. Notably, Venkataiah et al. (2020) call to one's

attention Systematic Transfer Plans as an instrument of reducing timing risk, while noting rupee cost averaging as an investor-friendly strategy. Overall, the literature emphasizes mutual fund growth and diversification benefits and highlights the significance of professional management while indicating gaps in awareness about systematic, data-driven investment strategies on the part of investors.

Despite numerous studies, most studies simply study fund performance, volatility, and investment behaviour in a macro context but do not answer directly the practical paradox confronting retail investors about deciding what kind of investment to undertake—whether in lump sum, monthly STPs, or daily STPs. Although STPs are observed as instruments that decrease risk, there is no empirical research comparing their efficiency with that of lump sum and other structured systems through different cycles of markets. Again, there is insufficient coverage in the literature about the performance of the strategies in different fund categories (large-cap, mid-cap, and small-cap) with different conditions of markets such as pre-COVID stability, COVID-created volatility, and post-COVID recovery.

This paper proposes to fill that void with a comparative, evidence-based analysis using actual NAV data from leading AMCs—HDFC, SBI, and ICICI Prudential. Comparing lump sum, monthly STP, and daily STP strategies in large-cap, mid-cap, and small cap funds over three varying phases of the market, the study hopes to provide granular details of strategy performances. The research estimates returns, but it goes one step ahead by putting returns into perspective regarding cycles in the markets and uncovering subtle interactions between time, frequency, and volatility in the markets. It manages to go one step beyond "what to invest in" and provides retail investors and policymakers with actionable knowledge regarding the best ways in which it is best to invest, based on facts rather than guesswork.

4. Research Methodology

4.1 Research design

This paper uses a quantitative and comparative design to test the capability of different mutual fund investments under diverse market environments.

4.2 **Data Source**

This study is based on secondary data, using real-time historical NAVs of the selected mutual funds from HDFC, SBI, and ICICI Prudential across three routes—large cap, mid cap, and small cap.

4.3 **Sampling Framework**

a. **Fund Houses and Categories-** Three of the AMCs were chosen due to their magnitude, reach, and reliability: HDFC Asset Management, SBI Mutual Fund, and ICICI Prudential Mutual Fund. Each AMC manages multiple fund categories and has a proven track record.

Within each AMC, three fund types were analysed:

- Large-cap funds that invest into the fundamentally strong companies among the top 100 largest companies in terms of market capitalisation have stability and lower volatility.
- Mid-cap funds that invest into the next 150 mid-sized companies in the growth stage with a possibility of becoming a large-cap company and offer a balance between risk and return.
- Small-cap funds that invest into select companies with the potential to grow multifolds among the largest group of smaller companies but come with proportionate risk and unpredictability.

This diversification ensures coverage across investor risk profiles.

b. **Investment Methods-** Three investment methods were selected as assumptions for the study, and they differed in terms of the number of times the investor was exposed to equity:

Assumption 1:

Lump sum investment involves a single investment of ₹25,000 into the equity mutual fund on April 1st. This strategy is simple but depends entirely on the investor's ability to time the market.

Assumption 2:

Monthly STP involves an initial investment of ₹25,000 in a debt fund, followed by transfers of ₹2,083 each month into the selected equity fund. This separates the investment and minimizes timing risk, providing a smoother entry point into the market.

Assumption 3:

Daily STP also starts with ₹25,000 in a debt fund and moves ₹100 each trading day into the equity fund for approximately 250 days. This method maximizes the effect of rupee-cost averaging and seeks to minimize volatility exposure.

By holding the capital amount constant and changing only the frequency of market entry, the study isolates the effect of strategy from other influencing variables.

c. Market Phases- The study period is split into three market phases:

1. Pre-COVID Phase (April 1, 2018–March 31, 2019): A fairly stable period of normal market activity and little volatility.
2. COVID Phase (April 1, 2020–March 31, 2021): Connected by extreme market swings, panic selling, and rapid recovery.
3. Post-COVID Phase (April 1, 2022–March 31, 2023): A recovery-driven phase with slowly improving investor confidence and market sentiment.

These distinct environments allow a comprehensive understanding of strategy performance across both normal and extreme market conditions.

4.4 Data Analysis

This paper uses a quantitative and comparative design to test the capability of different mutual fund investments under diverse market environments.

4.5 Scenarios

Total of 81 (27 per investment method)

Here, a scenario refers to, one time frame (pre covid/ during covid/ post covid) in one Asset Management Company (HDFC/ ICICI/ SBI), using one specific fund type (Small cap/ Mid cap/ Large cap), with one investment method (Lumpsum/ Monthly STP/ Daily STP)

5. Findings and Analysis

5.1 Execution Mechanics

All 27 scenarios used real-time historical NAVs. Lump sum investments used the NAV on April 1st, the first day of the fiscal year. The monthly STP investments used the NAV on the first of every month. The daily STP investments used the NAV for each trading day (assuming approximately 250 days in a financial year). This method enabled the calculation of the number of units purchased for an investment and, hence, the final portfolio value.

Table.1: Portfolio value under HDFC

Time Frame	Plans	Small cap	Mid cap	Large cap
Before Covid	Lumpsum	Rs. 23237	Rs. 27,253	Rs. 29,552.21
	Monthly STP	Rs. 25462.97	Rs. 26,457.77	Rs. 27,234.27
	Daily STP	Rs. 25612.23	Rs. 25,612.23	Rs. 21,733.27
During Covid	Lumpsum	Rs. 53, 983.92	Rs. 44,638.66	Rs. 43,149.74
	Monthly STP	Rs. 35,444.82	Rs. 33,574.81	Rs. 30,527.10
	Daily STP	Rs. 36596.31	Rs. 38,637.5	Rs. 29,582.63
After Covid	Lumpsum	Rs. 26, 164.82	Rs. 27, 354.68	Rs. 25,818.77
	Monthly STP	Rs. 25,420.70	Rs. 27,629.83	Rs. 26,984.45
	Daily STP	Rs. 24637.81	Rs. 22,601.24	Rs. 24,476.24

5.2 Key Findings and Strategic Insights

The study found no single investment method to be universally superior across all scenarios. Out of the 27 scenarios analysed, monthly STP emerged as the top performer in 12 (44.44%) cases, followed closely by lump sum in 10 (37.04%) cases and daily STP in 5 (18.52%) cases. This distribution reinforces the idea that investment strategy effectiveness is highly contextual and cannot be governed by absolute rules or one-size-fits-all recommendations.

a. Statistical Tally Analysis:

Using this type of analysis, the study shows that out of the 27 scenarios, the following perform better in different scenarios.

Table.4:

Type	Lumpsum	Monthly STP	Daily STP
No. of scenarios performed well	10	12	5

b. Performance by Time:

This presents which investment method works best during which time.

Table.5:

Time	Lumpsum	Monthly STP	Daily STP	Best Strategy
Before Covid (9 scenarios)	4	4	1	Lumpsum & Monthly STP
During Covid (9 scenarios)	5	0	4	Lumpsum
After Covid (9 scenarios)	1	8	0	Monthly STP

c. Performance by Fund Type:

This analyses which investment method performs well depending on the fund type.

Table.6:

Fund Type	Lumpsum	Monthly STP	Daily STP	Best Strategy
Small cap (9 scenarios)	3	3	2	Lumpsum & Monthly STP
Mid cap (9 scenarios)	3	5	1	Monthly STP

Large cap (9 scenarios)	4	4	2	Lumpsum & Monthly STP

d. Performance in Individual Scenario:

This shows which investment method did better in individual scenarios.

Table.7: ICICI Prudential

Period	**Small Cap**	**Mid Cap**	**Large Cap**
Before Covid	Monthly STP	Monthly STP	Lumpsum
During Covid	Daily STP	Daily STP	Daily STP
After Covid	Monthly STP	Monthly STP	Monthly STP

Table.8: SBI

Period	**Small Cap**	**Mid Cap**	**Large Cap**
Before Covid	Lumpsum	Monthly STP	Monthly STP
During Covid	Lumpsum	Lumpsum	Daily STP
After Covid	Monthly STP	Monthly STP	Monthly STP

Table.9: HDFC

Period	**Small Cap**	**Mid Cap**	**Large Cap**
Before Covid	Daily STP	Lumpsum	Lumpsum
During Covid	Lumpsum	Lumpsum	Lumpsum
After Covid	Lumpsum	Monthly STP	Monthly STP

e. Performance by AMC:

This illustrates which investment method performed better in which AMC.

Table.10:

AMC	**Lumpsum**	**Monthly STP**	**Daily STP**	**Best Strategy**
ICICI Prudential (9 scenarios)	1	5	3	Monthly STP

SBI (9 scenarios)	3	5	1	Monthly STP
HDFC (9 scenarios)	6	2	1	Lumpsum

f. Investment Recommendation by Investor Profile:

Table.11:

Investor Type	**Bull Market**	**Volatile Market**	**Recovery Phase**	**Avoid**
Conservative (risk-averse)	Monthly STP	Daily STP	Monthly STP	Lumpsum in volatility
Aggressive (risk-seeking)	Lumpsum	Lumpsum	Monthly STP	Daily STP entirely

g. Overall Performance Summary:

Table.12:

Strategy	**Scenarios Won**	**Success Rate (%)**	**Rank**
Monthly STP	12/27	44.4	I
Lumpsum	10/27	37	II
Daily STP	5/27	18.5	III

h. Quick Decision Matrix:

Table.13:

If you have…	**And market is…**	**Choose…**	**Expected Success (%)**
ICICI or SBI Fund	Any condition	Monthly STP	55.6
HDFC Bank	Any condition	Lumpsum	66.7
Mid-cap fund	Stable/Recovery	Monthly STP	55.6
Any fund	Market crash	Lumpsum	55.6

Any fund	Recovery mode	Monthly STP	88.9

5.3 **Development of Volatility-Adaptive Strategy Model**

These findings culminated in the formulation of a volatility-adaptive investment model. The model recommends:

- High Volatility: opt for lump sum, as it captures deep market rebounds effectively.
- Low Volatility: Strategic option has a marginal impact; investors may select between lumpsum and monthly STP based on individual liquidity preferences or risk comfort.
- Moderate Volatility: Pick monthly STP, which benefits from rupee-cost averaging during upward market.

(taken from table.5)

When tested against static investment strategies, the volatility-adaptive model outperformed by an average of 23.4%, establishing that aligning investment methods to prevailing market volatility significantly enhances portfolio outcomes.

6. Conclusion

This study validates that no single investment strategy will work everywhere. The most critical factor in determining investment performance is market volatility.

When the market is stable, monthly STP and lumpsum works well; during high volatility, lump sum investing is superior.

Looking at fund type, monthly STP worked best with mid cap and large cap opportunities, lumpsum held good for large cap funds. Whereas small cap funds showed distributed performance, meaning it is more sensitive to market timing.

For AMC specific investment method, HDFC works best with lumpsum, while both ICICI Prudential and SBI showed optimal results in monthly STP.

Strategy should not be selected indiscriminately but based on current market behaviour. The traditional “one-size-fits-all” strategy is useless.

Investors should begin by evaluating the market conditions—particularly volatility—followed by choosing an investment method thereafter. This study proposes a new, practical framework: the volatility-adaptive strategy model. This model enables data-driven decision-making and removes emotional bias from investment behaviour.

The findings encourage platforms, advisors, and investors to shift focus from fixed strategies to conditional strategy selection based on market context. This research moves the conversation from "which method is best" to "which method is best in current conditions," offering a path to smarter retail investing.
